Properties of Lead-Free Solders

Disclaimer: In the following database, companies and products are sometimes mentioned, but solely to identify materials and sources of data. Such identification neither constitutes nor implies endorsement by NIST of the companies or of the products. Other commercial materials or suppliers may be found as useful as those identified here.

Note: Alloy compositions are given in the form “Sn-2.5Ag-0.8Cu-0.5Sb,” which means: 2.5 % Ag, 0.8 % Cu, and 0.5 % Sb (percent by mass), with the leading element (in this case, Sn) making up the balance to 100 %.

Abbreviations for metallic elements appearing in this database:

Ag: silver	Cu: copper	Pt: platinum
Al: aluminum	In: indium	Sb: antimony
Au: gold	Mo: molybdenum	Tin: tin
Bi: bismuth	Ni: nickel	W: tungsten
Cd: cadmium	Pb: lead	Zn: zinc
Cr: chromium	Pd: palladium	
Sn-Ag-Cu: Refers to compositions near the eutectic		

Table of Contents:

1. **Mechanical Properties:** creep, ductility, activation energy, elastic modulus, elongation, strain rate, stress relaxation, tensile strength, yield strength

Table 1.1. Strength and Ductility of Low-Lead Alloys Compared with Alloy Sn-37Pb (NCMS Alloy A1), Ranked by Yield Strength (15 Alloys) and by Total Elongation (19 Alloys)

Table 1.2. Tensile Properties of Lead-Free Solders (two parts)

Table 1.3. Elastic Properties of Sn-37Pb (eutectic) and Sn-3.5Ag

Table 1.4. Elastic Properties of Sn-2.5Ag-0.8Cu-0.5Sb (Castin™) and Sn-37Pb Eutectic-A

Table 1.5. Elastic Properties of Sn-2.5Ag-0.8Cu-0.5Sb (Castin™) and Sn-37Pb Eutectic-B

Table 1.6. Parameters for Strain Rate: Norton Equation, $d\varepsilon/dt = A \cdot \sigma^n \cdot \exp(-Q/(RT))$; Dorn Equation, $d\varepsilon/dt = A \cdot (\sigma^n/T) \cdot \exp(-Q/(RT))$; Stress-relaxation Rate, $d\sigma/dt = A \cdot (\sigma - \sigma_t)^n \cdot \exp(-Q/(RT))$; and Strain-Rate Sensitivity, $\sigma = C \cdot (d\varepsilon/dt)^m$; for Two Lead-Free Solder Alloys, Sn-3.5Ag and Sn-9Zn.

Table 1.7. Steady-State Creep Properties and Associated Mechanisms for Three Lead-Free Solders and Sn-37Pb Eutectic

Table 1.8. Stress Exponents and Activation Energies for Dorn Equation for Tin and Four Lead-Free Solder Alloys

5. Useful References

5.1. References to Tabular Data

5.2. Reference Books

5.3. Useful URLs

Key words: alloys, aluminum, antimony, atomic weight, bibliography, bismuth, Castin, chemical, chromium, coefficient, composition, conductivity, copper, costs, creep, ductility, elastic, electrical, electronic, elements, elongation, eutectic, expansion, gold, hardness, indium, intermetallic, lead, lead-free, liquidus, material, mechanical, melting, metallic, modulus, molybdenum, nickel, packaging, palladium, physical, platinum, Poisson ratio, PCB, printed circuit board, properties, replacement, resistivity, silver, solders, solidus, strength, surface tension, temperature, tensile, thermal, thermophysical, tin, tungsten, viscosity, wetting, Young's modulus, zinc

Useful Conversion Factors

Standard Acceleration of Gravity, g:

$g = 32.174 \text{ f/s}^2 = 9.80665 \text{ m/s}^2$ (not to be confused with "gram", g)

Electrical Conductivity:

1 S (siemens) = $1 \Omega^{-1}$ (reciprocal ohm)

Density:

$1 \text{ g/cm}^3 = 0.036127 \text{ lb}_m/\text{in}^3 = 62.428 \text{ lb}_m/\text{ft}^3$

Energy:

1 cal = 4.187 J (joule)

1 Btu = 1055.056 J = 252 cal = 0.252 kcal (kilocalories)

Force: $1 \text{ lb}_f = 4.4482 \text{ N}$ (newton) $1 \text{ kg}_f = 9.80665 \text{ N}$ $1 \text{ dyne} = 10^{-5} \text{ N}$ **Length:** $1 \text{ in} = 2.54 \text{ cm} = 0.0254 \text{ m}$ (exact) $1 \text{ ft} = 30.48 \text{ cm} = 0.3048 \text{ m}$ (exact)**Mass:** $1 \text{ lb}_m = 0.45359 \text{ kg}; \quad 1 \text{ kg} = 2.20463 \text{ lb}_m$ **Pressure (or Tensile stress):** $1 \text{ Pa (pascal)} = 1 \text{ N/m}^2$ $1 \text{ psi} = 6894.76 \text{ Pa} = 6.89476 \text{ kPa}$ $1 \text{ kps} = 6.89476 \text{ MPa}$ **Specific Heat (Capacity):** $1 \text{ cal/(g}\cdot\text{K)} = 1 \text{ Btu}/(\text{lb}_m \cdot \text{F}) = 4.187 \text{ J/(kg}\cdot\text{K)}$ **Temperature; temperature intervals:**

Fahrenheit temperature $F = 1.8 \cdot C + 32$, where C is Celsius temperature

Kelvin temperature $K = C + 273.15$

1 K (1 kelvin) = 1°C (1 Celsius degree) = 1.8°F (1 Fahrenheit degree = temperature interval)

Thermal Conductivity: $1 \text{ W/(m}\cdot\text{K)} = 0.5778 \text{ Btu}/(\text{ft}\cdot\text{hr}\cdot{}^\circ\text{F})$ **Explanatory Note:**

This version (11 February 2002) represents our present collection of information on properties of lead-free solders. We are just now beginning to have enough properties data to begin consolidating duplicate data, to better organize the tables into a more useful order, and to begin some evaluation of uncertainties. Also, no systematic mining of resources from journals that publish articles on relevant properties of lead-free solders has yet been done by us, but is a planned next step. However these next steps await further funding. We hope to greatly extend the work beyond this present state into a larger and more useful one. Your patience is appreciated. – the authors

1. Mechanical Properties: creep, ductility, activation energy, elastic modulus, elongation, strain rate, stress relaxation, tensile strength, yield strength

Table 1.1. Strength and Ductility of Low-Lead Alloys Compared with Alloy Sn-37Pb (NCMS Alloy Code A1), Ranked by Yield Strength (15 Alloys) and by Total Elongation (19 Alloys)

Table 1.5. Elastic Properties of Sn-2.5Ag-0.8Cu-0.5Sb (Castin™) and Sn-37Pb Eutectic – B

Tensile Properties (1 ksi = 6.895 MPa)				
	Castin™		Sn-37Pb	
	(ksi)	(MPa)	(ksi)	(MPa)
	4300	29.65 (GPa)	5740	39.58 (GPa)
Young's Modulus	4.03	27.8	4.07	28.1
Yield Strength	5.56	38.3	5.91	40.7
UTS*	50.00		43.66	
Elongation (%)				
Compressive Properties				
	(ksi)	(MPa)	(ksi)	(MPa)
	10890	75.08 (GPa)	16600	11.45 (GPa)
	4.53	31.2	4.84	33.4
Young's Modulus	10.07	69.4	9.88	68.1
Yield Strength (0.2% strain)	13.5		12.2	
Stress (25 ° strain)				
Rockwell Hardness (16 W scale hardness)				

*Ultimate Tensile Strength

Note: It is not stated explicitly, but accompanying textual description suggests that the measured specimens of these alloys may have been first soaked at 125 °C before the properties listed in this table were measured. This may explain the differences in measured properties between this table and the previous one (A) comparing Castin™ with Sn-37Pb.

Karl Seelig and David Suraski, “The Status of Lead-Free Solder Alloys,” Proc. 50th IEEE 2000 Electronic Components and Technology Conference (May 21-24, 2000), Las Vegas, NV

Table 1.6. Parameters for Strain Rate (Norton Equation, $d\varepsilon/dt = A \cdot \sigma^n \cdot \exp(-Q/RT)$; and Dorn Equation, $d\varepsilon/dt = A \cdot (\sigma^n/T) \cdot \exp(-Q/(RT))$); Stress-relaxation Rate, $d\sigma/dt = A \cdot (\sigma - \sigma_t)^n \cdot \exp(-Q/(RT))$; and Strain-rate Sensitivity, $\sigma = C \cdot (d\varepsilon/dt)^m$; for Two Lead-Free Solder Alloys, Sn-3.5Ag and Sn-9Zn.

Here ε is strain, t is the time variable, $d\varepsilon/dt$ is strain rate (s^{-1}), A and C are constants, σ is stress (MPa), σ_t is a threshold stress for stress relaxation, n is the stress exponent, Q is an activation energy (kJ/mol), R is the universal gas constant, T is absolute temperature, and m is the strain-rate sensitivity.

Alloy		Norton		Dorn		Stress Relaxation	Temperature (°K)

Table 2.1.2. Melting Temperatures of Lead-Free Solders

Alloy	Melting Temperature Range (°C)	Comments [#]
Sn-25Ag-10Sb	233 (m.p.)	High strength; patented by Motorola ("Alloy J")
Sn-0.7Cu	227@	
Sn-3.5Ag	221@	Excellent strength and wetting
Sn-2Ag	221 – 226	
Sn-2.8Ag-20In	175 – 186	
Sn-5Sb*	232 – 240	Good high-temperature shear strength
Sn-58Bi	138@	Well established history; Inexpensive
Sn-9Zn	199*	Corrosion; high dross
Sn-0.5Ag-4Cu	217 – 350	Very wide and high melting range; Engelhard's lead-free plumbing solder
Sn-2Ag-0.75Cu	217 – 219	
Sn-3.2Ag-0.5Cu	217 – 218	
Sn-3.8Ag-0.7Cu	217 – 220	
Sn-4Ag-0.5Cu	217 – 225	
Sn-4Ag-1Cu	217 – 220	
Sn-4.7Ag-1.7Cu	217 – 244	
Sn-8Zn-3Bi	192 – 197	
Sn-0.2Ag-2Cu-0.8Sb	287 – 218	High melting range; Kester Solder Co.'s Aquabond
Sn-2.5Ag-0.8Cu-0.5Sb (Castin)	217 – 225	
Sn-2Ag-7.5Bi	190 – 216	
Sn-3.4Ag-4.8Bi	201 – 205	(205 – 210)%
Sn-3.5Ag-3Bi	208 – 217	(m.p.: 220 °C)%
Sn-2Ag-3Bi-0.75Cu%	205 – 217	
Sn-3.5Ag-5Bi-0.7Cu%	198 – 213	
Sn-2Ag-4Bi-0.5Cu-0.1Ge%	202 – 217	
Sn-57Bi-0.1Ag%	138 – 140	
Sn-52In	118*	Lowest melt. pt.: expensive

A. Solder Alloy for Plated Through Holes

A series of investigations to reduce the solidus temperature and strength of lead-free solders (by adding indium, which is very ductile) was carried out by NCMS. Beginning with three alloys: (1) Sn-3.5Ag ($T_{melt}=221\text{ }^{\circ}\text{C}$), (2) Sn-3Ag-2Bi ($T_{onset}=216\text{ }^{\circ}\text{C}$), and (3) Sn-3.33Ag-4.83Bi ($T_{onset}=212\text{ }^{\circ}\text{C}$). A solder alloy with composition Sn-3.5Ag-5.0In, with addition of either 1 % or 2 % (by mass) Cu was found to reduce the alloy's melting temperature by 5 $^{\circ}\text{C}$ and also desirably decreased the alloy's strength, reducing the probability of its cracking due to buildup of residual stress during thermal cycling (cooling after a soldering operation).

3. Candidate Alloys for Replacing Lead-Alloy Solders

Table 3.1. Criteria for Down-Selection of Lead-Free Alloys

Property	Definition	Minimum Acceptance Level
Liquidus temperature Pasty Range	Temperature at which solder alloy is completely molten Range of temperature between solidus and liquidus, where alloy is part solid and part liquid.	< 30 (°C)
Wettability	Assessed by force required to wet a copper wire with molten solder. A large force indicates good wetting, as does short duration t_0 at zero wetting force and time $t_{2/3}$ to reach two thirds of maximum wetting force.	$F_{max} > 300 \mu N$ $t_0 < 0.6 s$ $t_{2/3} < 1 s$
Area of Coverage Drossing	Measures coverage of copper test piece by solder Measured by amount of oxide formed in air on surface of molten solder after a fix duration at soldering temperature	> 85 % Qualitative
TMF Thermal Mismatch	Lifetime at a given failure rate compared to that of (eutectic) Sn/37Pb, for a specific configuration of board and solder joint Difference in coefficients of thermal expansion that causes unacceptable thermal stress	> 75 % < 29 ppm/°C
Creep Yield Strength Elongation	Stress load to failure at room temperature, in 10,000 minutes (~167 hours) Relative elongation of material under uniaxial tension at room temperature	> 500 psi > 2000 psi > 10 %

Table 3.2. Chemical compositions of 79 lead-free solder alloys down-selected for preliminary testing by the National Center for Manufacturing Sciences (NCMS). The seven lead-free alloys in bold type are those down-selected for extensive testing and measurement from the initial pool of 79. Selection process is detailed in Technical Reports for the Lead Free Solder Project: Properties Reports: "Down Selection," on Lead Free Solder Project CD-ROM, National Center for Manufacturing Sciences (1998).

4. Miscellaneous

A. Major considerations for replacement of lead-free solders:

- ◆ Melting (or solidus) temperature similar to that of Sn-37Pb solder
- ◆ Other physical properties (such as ductility, tensile strength, thermal conductivity and expansion, electrical conductivity) as good as, or better than, those of Sn-37Pb solder
- ◆ Narrow plastic range
- ◆ Capability of being fabricated into contemporary physical forms of solder, such as wire, preforms, ribbon, spheres, powder, and paste
- ◆ Adequate wetting properties and viscosity
- ◆ Acceptably low dross formation when used in wave soldering
- ◆ Compatibility with existing systems of liquid flux
- ◆ For paste, adequate shelf life and performance
- ◆ No toxicity problems

Table 4.1. Designation and Composition of Lead-Free Solders.

A.C. = "Alloy Code"; L = liquidus; S = solidus; P.R. = pasty range; CTE = coefficient of thermal expansion. Blank cells indicate either zero composition or no available data.

F43	91.5	2.5		1	5		Ag reduced to increase ductility; Cu added to improve wetting. Same room-temperature strength as for F2.	205	140			7.37		
F44	91.5	1.5		2	5		Ag reduced to increase ductility; Cu added to improve wetting. Same room-temperature strength as for F2.	205	140			7.36		
F45	91.5	0.5		3	5		Ag reduced to increase ductility; Cu added to improve wetting. Same room-temperature strength as for F2.	212				7.35		
F46	95		5				Ag replaced by 5% Bi to lower melting point.	222				7.39		
F47	94		5		1		Ag replaced by 5% Bi to lower melting point; 1% In added to increase ductility, lower melting pt.	221				7.39		

Designation and Composition of Lead-Free Solders (cont.)

A. C.	Composition (% by Mass)						Comments	Melting Temperature (°C)			Density (g/cm³)		Spec- ific Heat (J/g K)	CTE (μm per m.°C)
	Sn	Ag	Bi	Cu	In	Pb		L	S	P. R.	Meas.	Calc.		
	F48	92		5		3		215			7.39			
F49	90		5		5		Ag replaced by 5% Bi to lower melting point; 3% In added to increase ductility, lower melting pt.	210			7.39			
F50	95				5		Sn only, with 5% In added to increase ductility, lower melting pt	221			7.30			
F51	93.5	0.5		1	5		Reintroduce Ag; add Cu at eutectic composition; complements F43-F45.				7.33			
F52	92.5	1.5		1	5		Add more Ag; add Cu at eutectic composition; complements F43-F45.				7.35			

Designation and Composition of Lead-Free Solders (cont.)

A. C.	Composition (% by Mass)						Comments	Melting Temperature (°C)			Density (g/cm³)		Spec- ific Heat (J/g K)	CTE (µm per m.°C)
	Sn	Ag	Bi	Cu	In	Pb		L	S	P. R.	Meas.	Calc.		
	F53	94		1		5						7.32		
F54	92		3		5		Increase Bi; keep In at 5%.					7.36		
F55	94.5	0.5			5		Remove Bi, reintroduce Ag; keep In at 5%.					7.31		
F56	93.5	1.5			5		Increase Ag; keep In at 5%.					7.33		
F57	94.15	3.41				2.44	2.5% Pb added to A4; Sn/Ag ratio maintained same as in A4					7.44		
F58	91.90	3.33				4.76	5% Pb added to A4; Sn/Ag ratio maintained same as in A4					7.50		
F59	89.56	3.32	4.68			2.44	2.5% Pb added to F17; Sn/Ag ratio maintained same as in F17					7.53		
F60	87.43	3.24	4.57			4.76	5% Pb added to F17; Sn/Ag ratio maintained same as in F17					7.59		

Designation and Composition of Lead-Free Solders (cont.)

A. C.	Composition (% by Mass)						Comments	Melting Temperature (°C)			Density (g/cm³)		Spec- ific Heat (J/g K)	CTE (µm per m.°C)
	Sn	Ag	Bi	Cu	In	Pb		L	S	P. R.	Meas.	Calc.		
F61	92.68				4.88	2.44	2.5% Pb added to F50; Sn/In ratio maintained same as in F50					7.37		
F62	90.48				4.76	4.76	5% Pb added to F50; Sn/In ratio maintained same as in F50					7.43		
F63	97.5	2.5										7.36
